Email Deliverability Diagnostic Tool

Built for non-technical African SME business owners

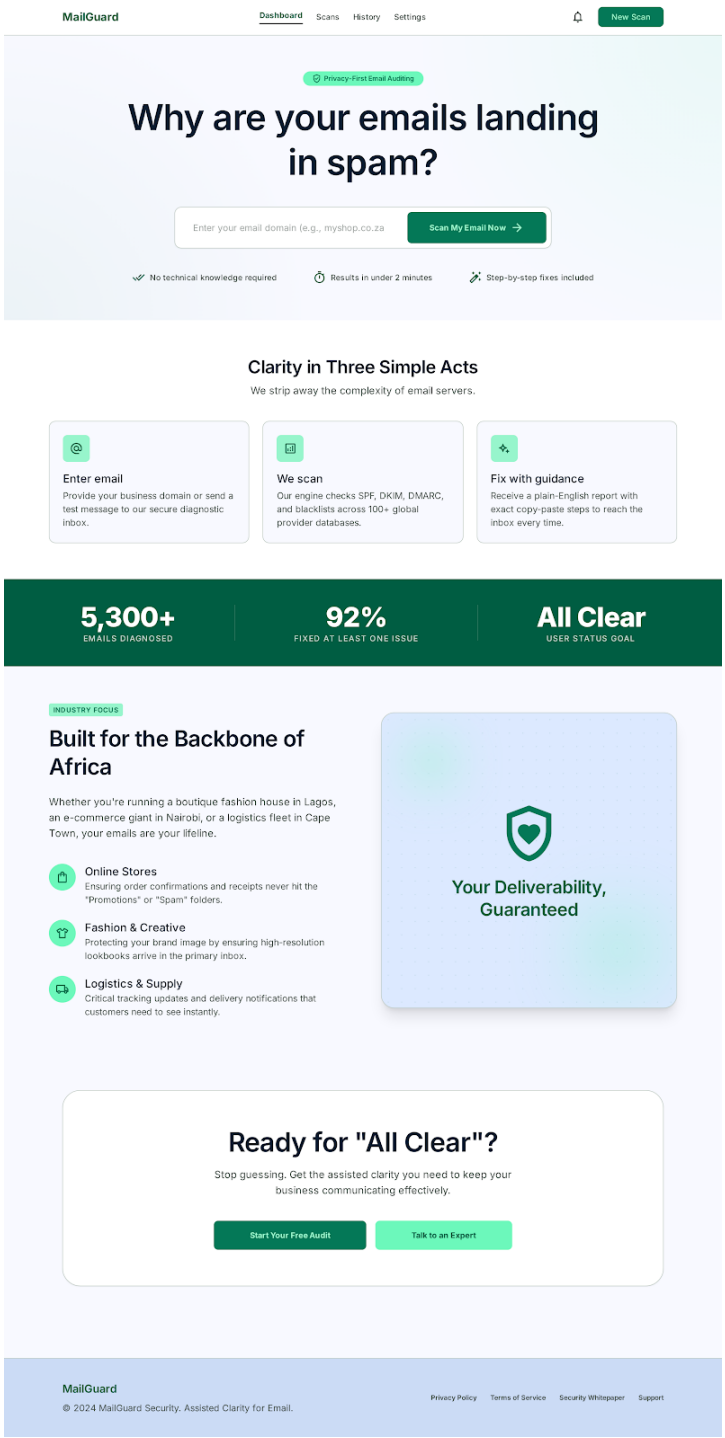

Team: Tofunmi (Panda) · Samuel (Fikayo) · Sanni Yusuf
Stack: React · FastAPI · PostgreSQL · Claude API
Status: Phase 1 — Foundation Setup

Product Promise

In less than two minutes, any non-technical African business owner should be able to understand why their emails are going to spam, fix the problem step by step, and verify that the fix worked — without needing technical support.

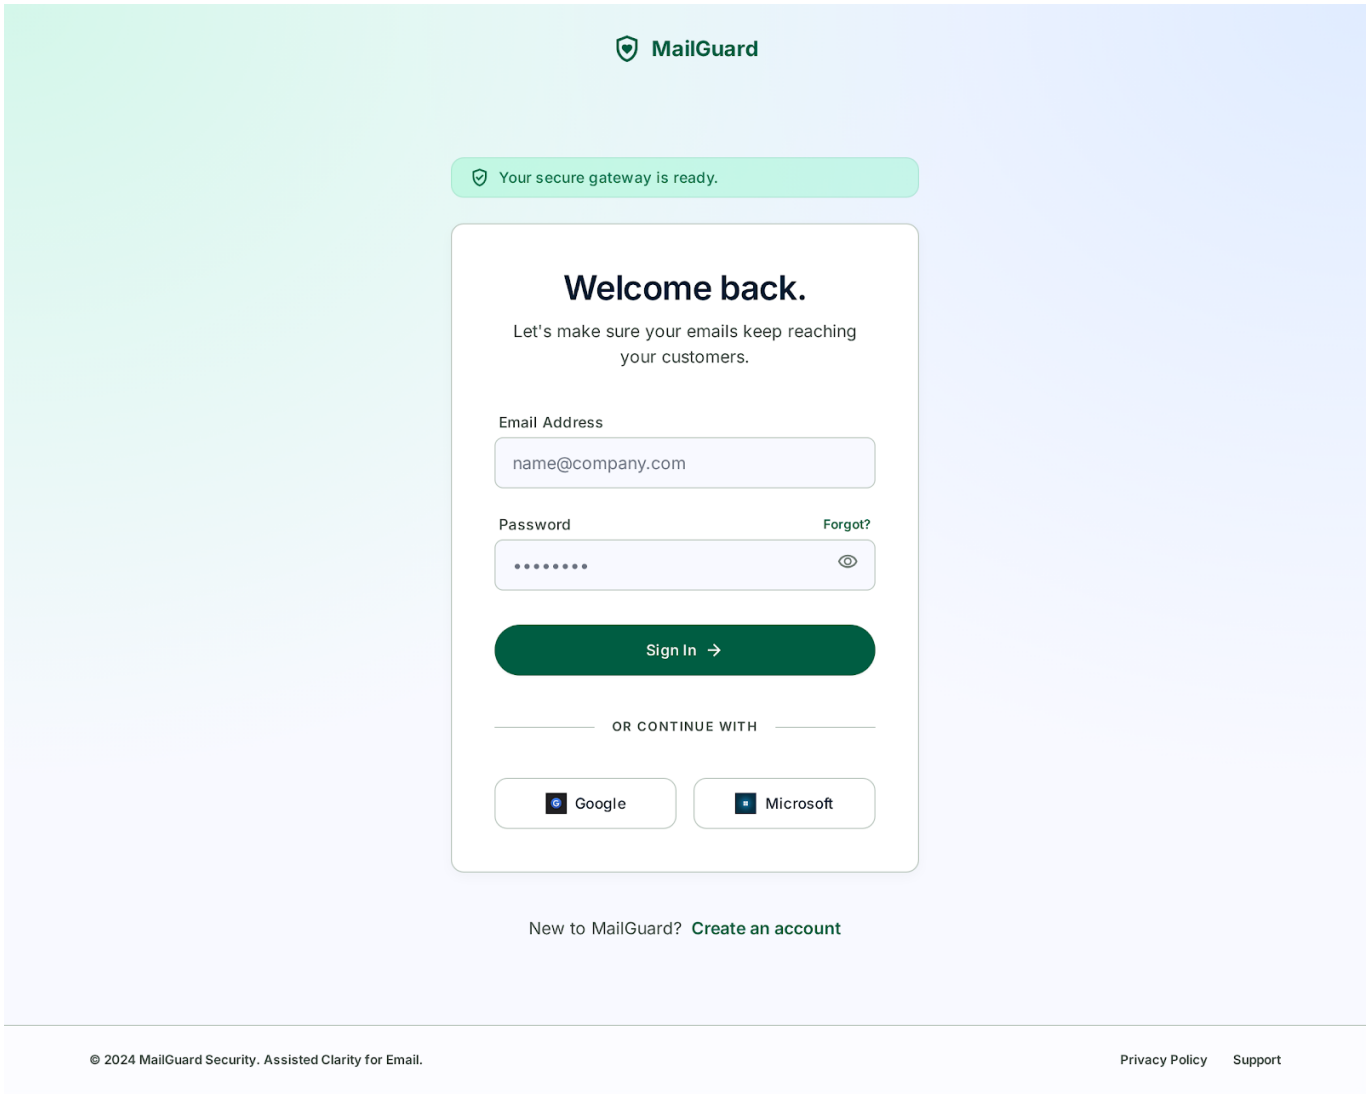

01 — Landing Page

The hero is the scan input itself. First thing users see: 'Why are your emails landing in spam?' with a domain input and CTA. Below: How It Works (3 steps), Built for the Backbone of Africa, social proof (5,300+ emails diagnosed, 92% fixed at least one issue), and footer. No stock photos. No jargon.

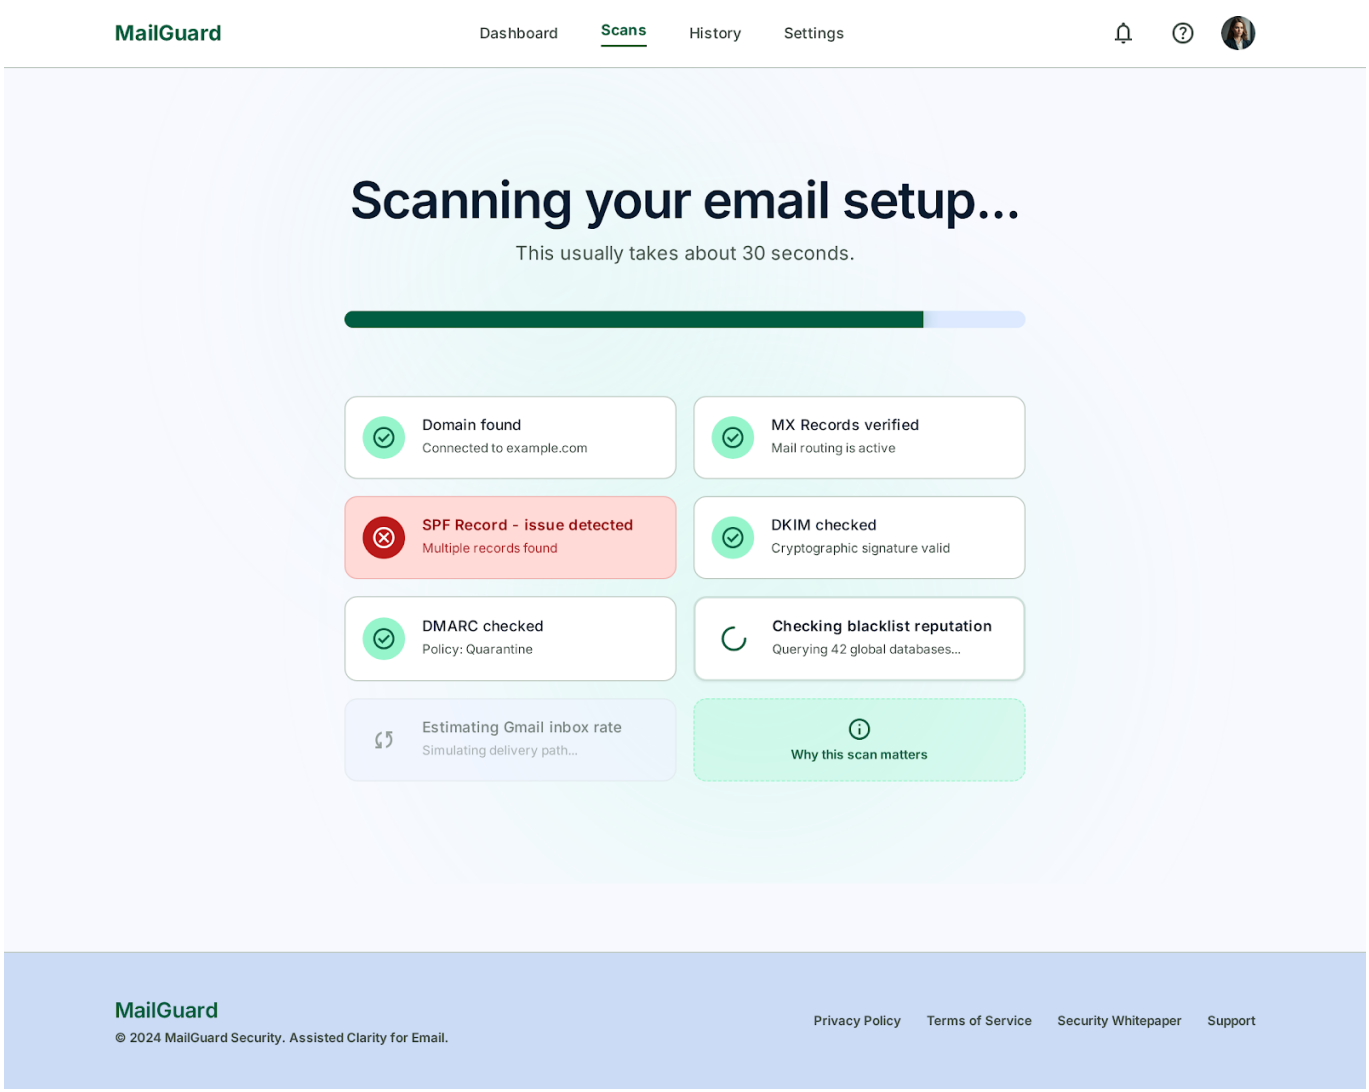

02 — Login / Register

Brand voice kept consistent. 'Welcome back. Let's make sure your emails keep reaching your customers.' Clean centered card, email + password fields, Google and Microsoft OAuth options, and a 'Create an account' link.

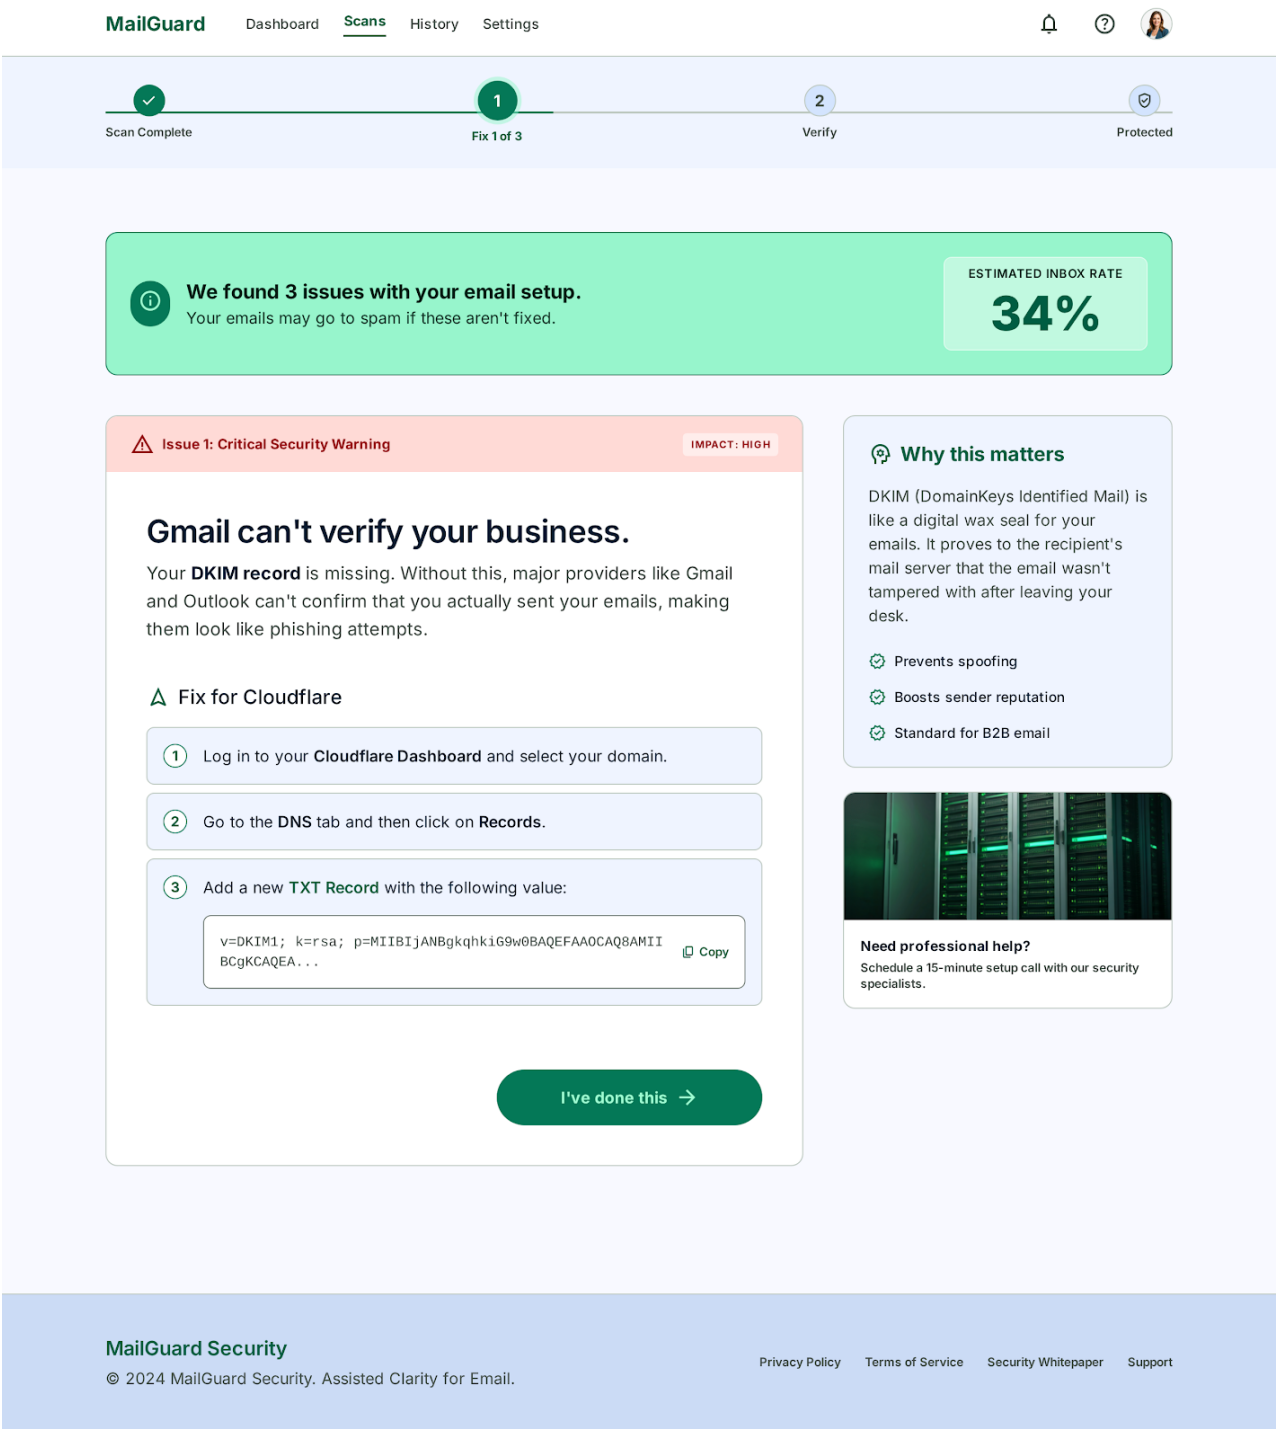

03 — Scanning Screen

'Scanning your email setup... This usually takes about 30 seconds.' Live checklist appears one by one: Domain found, MX Records, SPF (issue detected in red), DKIM, DMARC, Blacklist check (in progress), Gmail inbox rate estimation. Feels intelligent and alive — not instant.

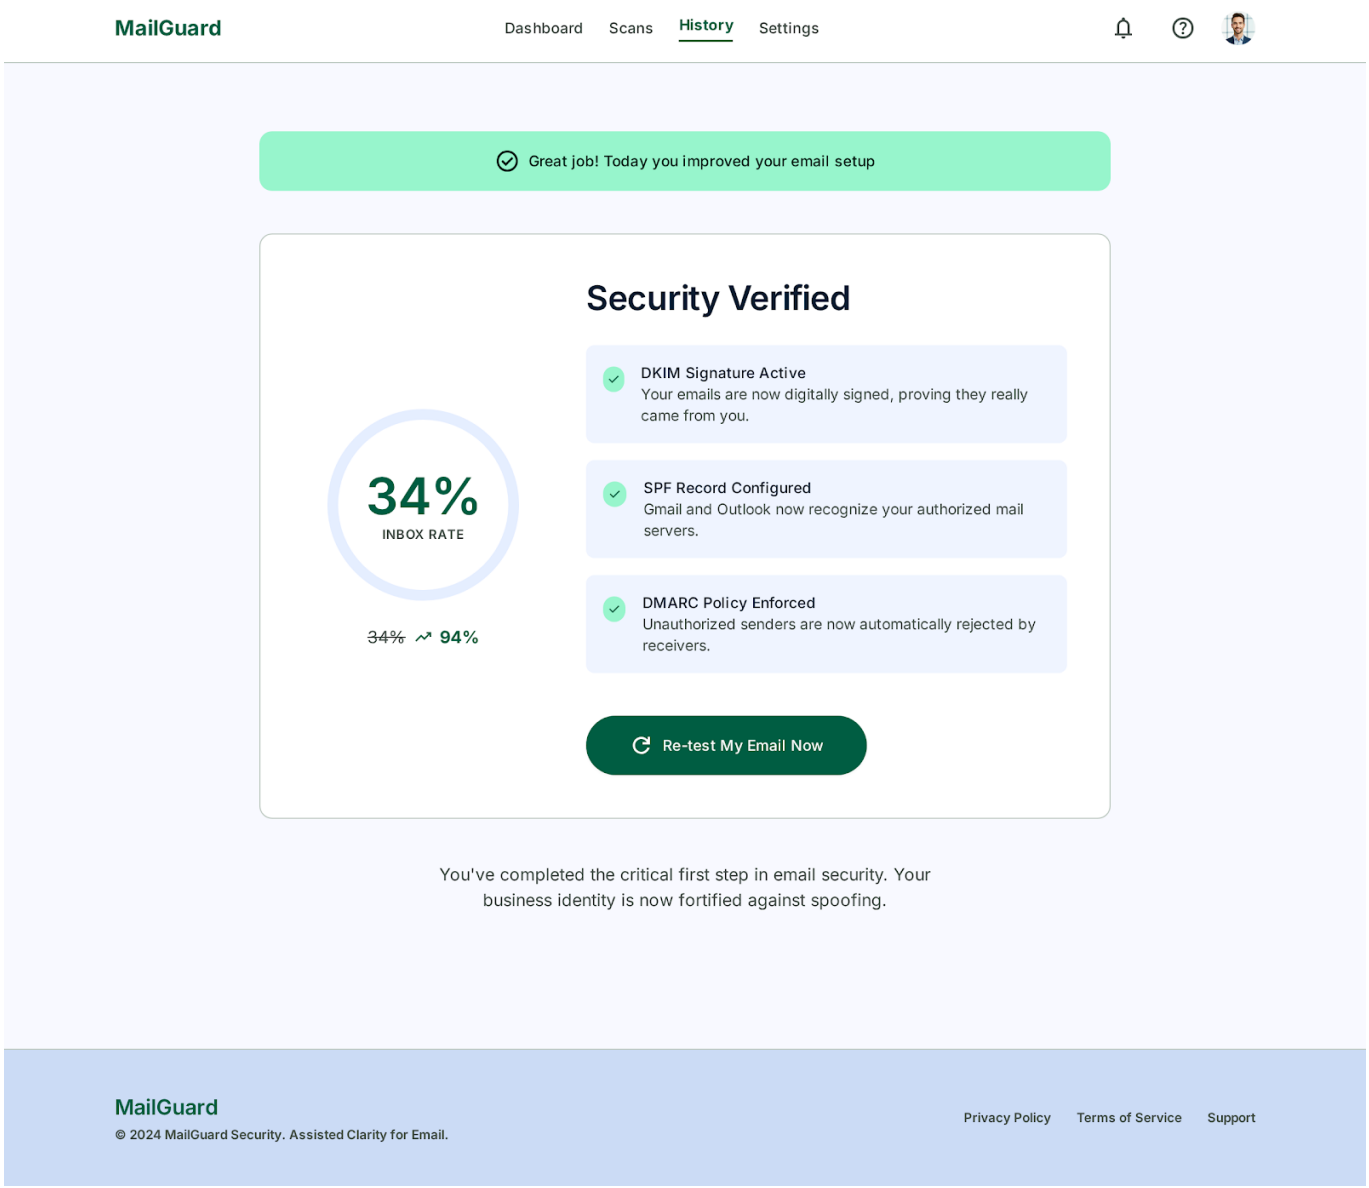

04 — Scan Results (Fix 1 of 3)

Mission progress bar at top: Scan Complete → Fix 1 of 3 → Verify → Protected. Human summary: 'We found 3 issues. Estimated inbox rate: 34%.' ONE issue at a time. 'Gmail can't verify your business. Your DKIM record is missing.' Provider-specific fix steps for Cloudflare. Copy button for DNS record. 'I've done this →' CTA. 'Why this matters' sidebar with plain English explanation.

05 — Celebration Screen

'Great job! Today you improved your email setup.' Security Verified state showing all fixed issues with checkmarks: DKIM Signature Active, SPF Record Configured, DMARC Policy Enforced. Inbox improvement shown: 34% → 94%. 'Re-test My Email Now' CTA. Reinforces the value of what the user just accomplished.

06 — User Dashboard

'Active Monitoring — Review your domain performance and email health status.' Minimal clean table: Domain, Inbox Rate, Issues Found, Last Scan Date, Status. Status labels: Protected, Needs Review, Stale. 'Run New Scan' button at top. Secondary to the scan experience — not the star of the product.
